

MANUFACTURER GUIDELINES TEXTILENE® Dimout™

Dimout, developed by Twitchell Technical Products, represents a pioneering innovation in the industry. This exceptional fabric is crafted from PVC-coated polyester and intricately woven to exhibit a dense, canvas-like texture. It offers superior UV protection and ensures privacy without plunging a space into complete darkness. Additionally, Dimout is antimicrobial, comes with a 15-year limited warranty, and is effortlessly maintainable.

- Dimout fabric is not designed to serve as a complete blackout material. However, it offers privacy both day and night through varying degrees of translucence, whether under natural or artificial light.

- "Star Lighting," characterized by tiny pinprick-like openings, is anticipated to appear within the weave due to its .5% openness, unlike traditional room-darkening or blackout fabrics that are fully opaque. The visibility of this star lighting effect can vary based on the angle and the intensity of light passing through the material.
- It's common to observe striations, either vertical or horizontal symmetrical lines, within the weave. This natural occurrence results from the weaving process and may become more noticeable in direct daylight. The fabric's performance remains unaffected. Lighter colors are generally more prone to this visual characteristic.

This document serves as the aesthetic guidelines established by Twitchell Technical Products, the fabric manufacturer. Should you have any questions or concerns, please reach out to your Sales Manager.
